# 1. Introduction

## 1.1 Background

Recent technical work (Jacobs, 2018) confirmed that Barwon Water's pumping from the Barwon Downs borefield over the past 30 years is the main cause of a reduction in baseflow (groundwater contribution to streamflow) in the lower reach of Boundary Creek, increasing the frequency and duration of no flow periods. The dry climate experienced in the same period and ineffective management measures were also considered contributing factors.

Lack of flow, especially during summer months has caused:

- Big Swamp to dry out,
- The oxidation of naturally occurring acid sulfate soils in the swamp, and
- The release of acidic water (pH less than 4) downstream of the swamp.

In response to this, Barwon Water was issued with a section 78 Ministerial Notice in September 2018, to legally enforce the development and implementation of a remediation plan for Boundary Creek, Big Swamp and surrounding environments impacted by past groundwater extraction. The Big Swamp and Surrounding Environment Remediation and Environmental Protection Plan (REPP) has been developed to address this requirement. The REPP sets out success criteria for the remediation of the swamp addressing a range of environmental factors and includes requirements for long-term monitoring. The ecological success criteria for the current study are:

- No further encroachment of terrestrial woodland into the swamp plain.
- No encroachment of Lowland Forest dominant species into areas of Damp Forest.
- No loss of structural or floristic diversity along the main channel and western end of the swamp.
- Increase diversity of understorey species within the swamp plain, with a focus on ferns and sedges.

Eco Logical Australia (ELA) has been engaged by Barwon Water to undertake the vegetation monitoring of Big Swamp in accordance with the REPP.

## 1.2 Study area

The proposed study area covers the wetland and riparian extent of Big Swamp near Yeodene, Victoria within parcels 115A\PP3987 and 1\PS501652 (Figure 1). This 22-hectare area is defined by the hydrological influence of Boundary Creek and the associated groundwater-dependant ecosystem. Areas outside of the immediate influence of the swamp's hydrology, including those upstream/slope of the swamp and downstream of the parcels identified, are not included in the study area.

### 1.3 Aims and objectives

The aim of the monitoring is to assess changes in the condition, extent and diversity of native vegetation against the remediation success criteria set out in the REPP.

The objectives of this study are:

- Resurvey the existing 50-metre-long point transects established as part of the ecohydrological assessment (Ecological Australia 2019).
- Install and survey a further three transects in Big Swamp to cover ecological gradients within the swamp considered important for future monitoring.
- Establish flora quadrats in each of the ecohydrological zones to measure floristic diversity.

### 1.4 Vegetation condition metrics

The ecological success criteria for the study area refer to measures of structural and floristic diversity to quantify change in vegetation condition over time.

Floristic species diversity is the variability among all organisms classified under the kingdom Plantae. This includes, flowering plants, conifers, ferns and fern allies, but excludes Fungi and most Algae.

Structural diversity is defined as the variability in plant abundance and form among organisms classified under the kingdom Plantae. Structural diversity measures heterogeneity or evenness of plant diversity by taking into account whether plant cover is attributed to many species, or dominated by few species (Magurran 2004).

Diversity statistics fall into two categories, which are used in this analysis

- Flora species richness – a count of all flora species recorded in a given area, and
- Flora species diversity using Simpsons Diversity Index – an index which takes species richness and species cover into account, giving an indication of the structural diversity.

High levels of floristic and structural diversity are indicators of a healthy, functioning ecosystem. This recognises that when disturbance is minimised, or within the bounds of what would be considered normal for the system, complexity in both the type and form of plants will increase over time.

## 2. Existing environment

The ecology of Big Swamp is complex and intricately linked to the hydrology of the site. The hydrology is in turn informed by a range of factors including soils, topography and climate, as well as surface water use upstream and ground water extraction from the underlying deep aquifer leading to greater rates of surface water infiltration throughout the catchment.

From as early as the 1800s, the swamp has been affected by changing land and water use as vegetation clearance and agricultural practices expanded across the region. This activity has continued to the current day, with the extraction of ground water from the deep Tertiary aquifer, and subsequent reduction in surface flows into the swamp, the most recent pressure on the system. Unfortunately, the cumulative effects have come to a head over the past 20 years with drought conditions triggering intensive ground water extractions and severely limiting surface flows into the swamp. The result was the drying of the swamp through the 1990s and 2000s. While difficult to ascertain, this drying may have commenced prior to groundwater extraction as the installation of MacDonalDs Dam upstream would have changed the flow regime along Boundary Creek from the late 1970s. As the water table dropped and drying occurred, both the vegetation and underlying soil layers rich in organic carbon became susceptible to fire, with two major events occurring in 1998 and 2011. The latter fire resulted in an almost complete loss of vegetation cover across the swamp, substantially altering the structure of the communities throughout. Subsequently, it appears erosion of the swamp plain, likely driven by large rainfall events combined with exposed post-fire soils, has concentrated surface flows into a primary channel that now bisects the plain. The resulting eroded sediment appears to have in part accumulated at the eastern end of the swamp in the form of a plug, leading to the formation of a pool of standing water which persists year-round.

The recent assessment of historical and current vegetation diversity and condition within Big Swamp completed by Eco Logical Australia (2019) identified three distinct ecohydrological zones within the swamp (Figure 1). Within each zone, vegetation associations based on known community types and floristic and structural condition were identified. The zones and associations identified formed the basis for the success criteria and associated monitoring program, and include:

### 2.1 Swamp Plain

The Swamp Plain is dominated by the recently described Riparian Fern Scrub (EVC A120) vegetation community. Riparian Fern Scrub is endangered and restricted to the Otway Ranges and possibly higher rainfall areas of the Gippsland Plain (Frood unpublished). This community commonly occurs on humous-rich soils and requires near-continuous waterlogging of the soil with shallow, often prolonged, periods of inundation. Where conditions result in frequent or prolonged inundation, sedges and rushes are likely to be dominant in the understorey. Alternatively, drier conditions would see a shift to a fern dominated understorey with emergent trees common.

The majority of this community has been significantly modified by the previous fires resulting in the loss of much of the original understorey diversity. The most heavily affected areas are now dominated by Prickly Tea-tree (*Leptospermum continentale*) or Scented Paperbark (*Melaleuca squarrosa*) with occasional patches of Austral Bracken (*Pteridium esculentum*) and/or Red-fruit Saw-sedge (*Gahnia sieberiana*). More intact patches occur in the far west of the swamp in areas apparently less affected by

fires, supporting a diverse ground layer dominated by various sedges such as Tall Sedge (*Carex appressa*) and Tassel Sedge (*Carex fascicularis*). Areas closer to the main channel in the north of the site contained a braided system of channels and supported a higher cover of sedges and ferns, including additional species such as Spreading Rope-rush (*Empodisma minus*) and Scrambling Coral-fern (*Gleichenia microphylla*). Riparian Fern Scrub vegetation associations identified within the swamp are listed in Table 1.

**Table 1. Riparian Fern Scrub vegetation associations in Big Swamp**

Vegetation associations	Description	Floristic diversity	Structural diversity	Dominant species
High-diversity riparian fern scrub (RFS120-A)	A structurally and floristically complex riparian scrub exhibiting a diversity of fine-scale variation.	High	Moderate-high	Woolly Tea-tree ( <i>Leptospermum lanigerum</i> ), Tall Sedge ( <i>Carex appressa</i> ), Tassel Sedge ( <i>Carex fascicularis</i> )
Dry riparian fern scrub (RFS120-B)	Dense to open scrub with a ground layer of Bracken, occasional emergent <i>Eucalyptus ovata</i> .	Low	Low-moderate	Prickly Tea-tree ( <i>Leptospermum continentale</i> ), Scented Paperbark ( <i>Melaleuca squarrosa</i> ), Austral Bracken ( <i>Pteridium esculentum</i> )
Wet riparian fern scrub (RFS120-C)	Dense scrub with little or no understorey, interspersed with narrow channels supporting a low-diversity of sedges and ferns. Occasional emergent <i>Eucalyptus ovata</i> .	Low-moderate	Low-moderate	Prickly Tea-tree ( <i>Leptospermum continentale</i> ), Scented Paperbark ( <i>Melaleuca squarrosa</i> ), Red-fruit Saw-sedge ( <i>Gahnia sieberiana</i> )

## 2.2 Damp woodlands

Damp woodlands occur on the lower slopes to the south and east of the main swamp, in areas that are unlikely to experience inundation in normal years. They would still have been heavily dependent on ground water with near-constant access to water within the root zone of mature trees and shrubs.

This community was dominated by young Swamp Gum (*Eucalyptus ovata*) with a very species-poor understorey containing Austral Bracken and Red-fruit Saw-sedge. Whilst this community has been described as Damp Sands Herb-rich Woodland due to its current structural and floristic characteristics (which is likely a result of recent fires and changes in hydrology), this vegetation is considered to represent a derived state of the Swamp Gum (*Eucalyptus ovata*) Forest described by Carr and Muir (1994). This community has been identified throughout the region on the lowest slopes in association with braided streams, swampy flats and swamp margins, and is believed to have occupied the southern margin and eastern end of Big Swamp prior to extraction commencing. Damp Sands Herb-rich Woodland vegetation associations identified within the swamp are listed in Table 2.

Lowland Forest (EVC 16) occurs on the slopes surrounding Big Swamp, upslope from Damp Sands Herb-rich Woodland, in areas unaffected by water-logging or inundation. This floristically diverse community is dominated by Messmate Stringybark (*Eucalyptus obliqua*) and Manna Gum with a high cover of Austral Bracken. Prominent shrubs included Silver Banksia (*Banksia marginata*), Prickly Moses (*Acacia*

*verticillata*) and Sweet Bursaria (*Bursaria spinosa*). Lowland Forest vegetation associations identified adjacent to the swamp are listed in Table 2.

**Table 2. Damp Sands Herb-rich Woodland and Lowland Forest vegetation associations in Big Swamp**

Vegetation associations	Description	Floristic diversity	Structural diversity	Dominant species
Modified, open Damp Sands Herb-rich Woodland (DSHW3-A)	A highly modified, immature woodland comprised of small stands of recruiting Swamp Gum interspersed with open, treeless areas of Austral Braken.	Low	Low	Swamp Gum ( <i>Eucalyptus ovata</i> ) and Austral Braken ( <i>Pteridium esculentum</i> )
Modified, closed Damp Sands Herb-rich Woodland (DSHW3-b)	A modified, dense woodland of recruiting Swamp Gum. While generally supporting a limited understorey, small pockets of diversity were observed throughout.	Low-moderate	Low-moderate	Swamp Gum ( <i>Eucalyptus ovata</i> ), Austral Braken ( <i>Pteridium esculentum</i> ) and Prickly Moses ( <i>Acacia verticillata</i> )
Lowland Forest (LF16-A1)	A diverse woodland with varied canopy cover dominating the drained, eastern-most edge of the swamp. Likely colonised the area due to draining of the swamp downstream.	High	High	Brooker's Gum ( <i>Eucalyptus brookeriana</i> ), Hazel Pomaderris ( <i>Pomaderris aspera</i> ), Soft Tree-fern ( <i>Dicksonia antarctica</i> )

### 2.3 Main Channel

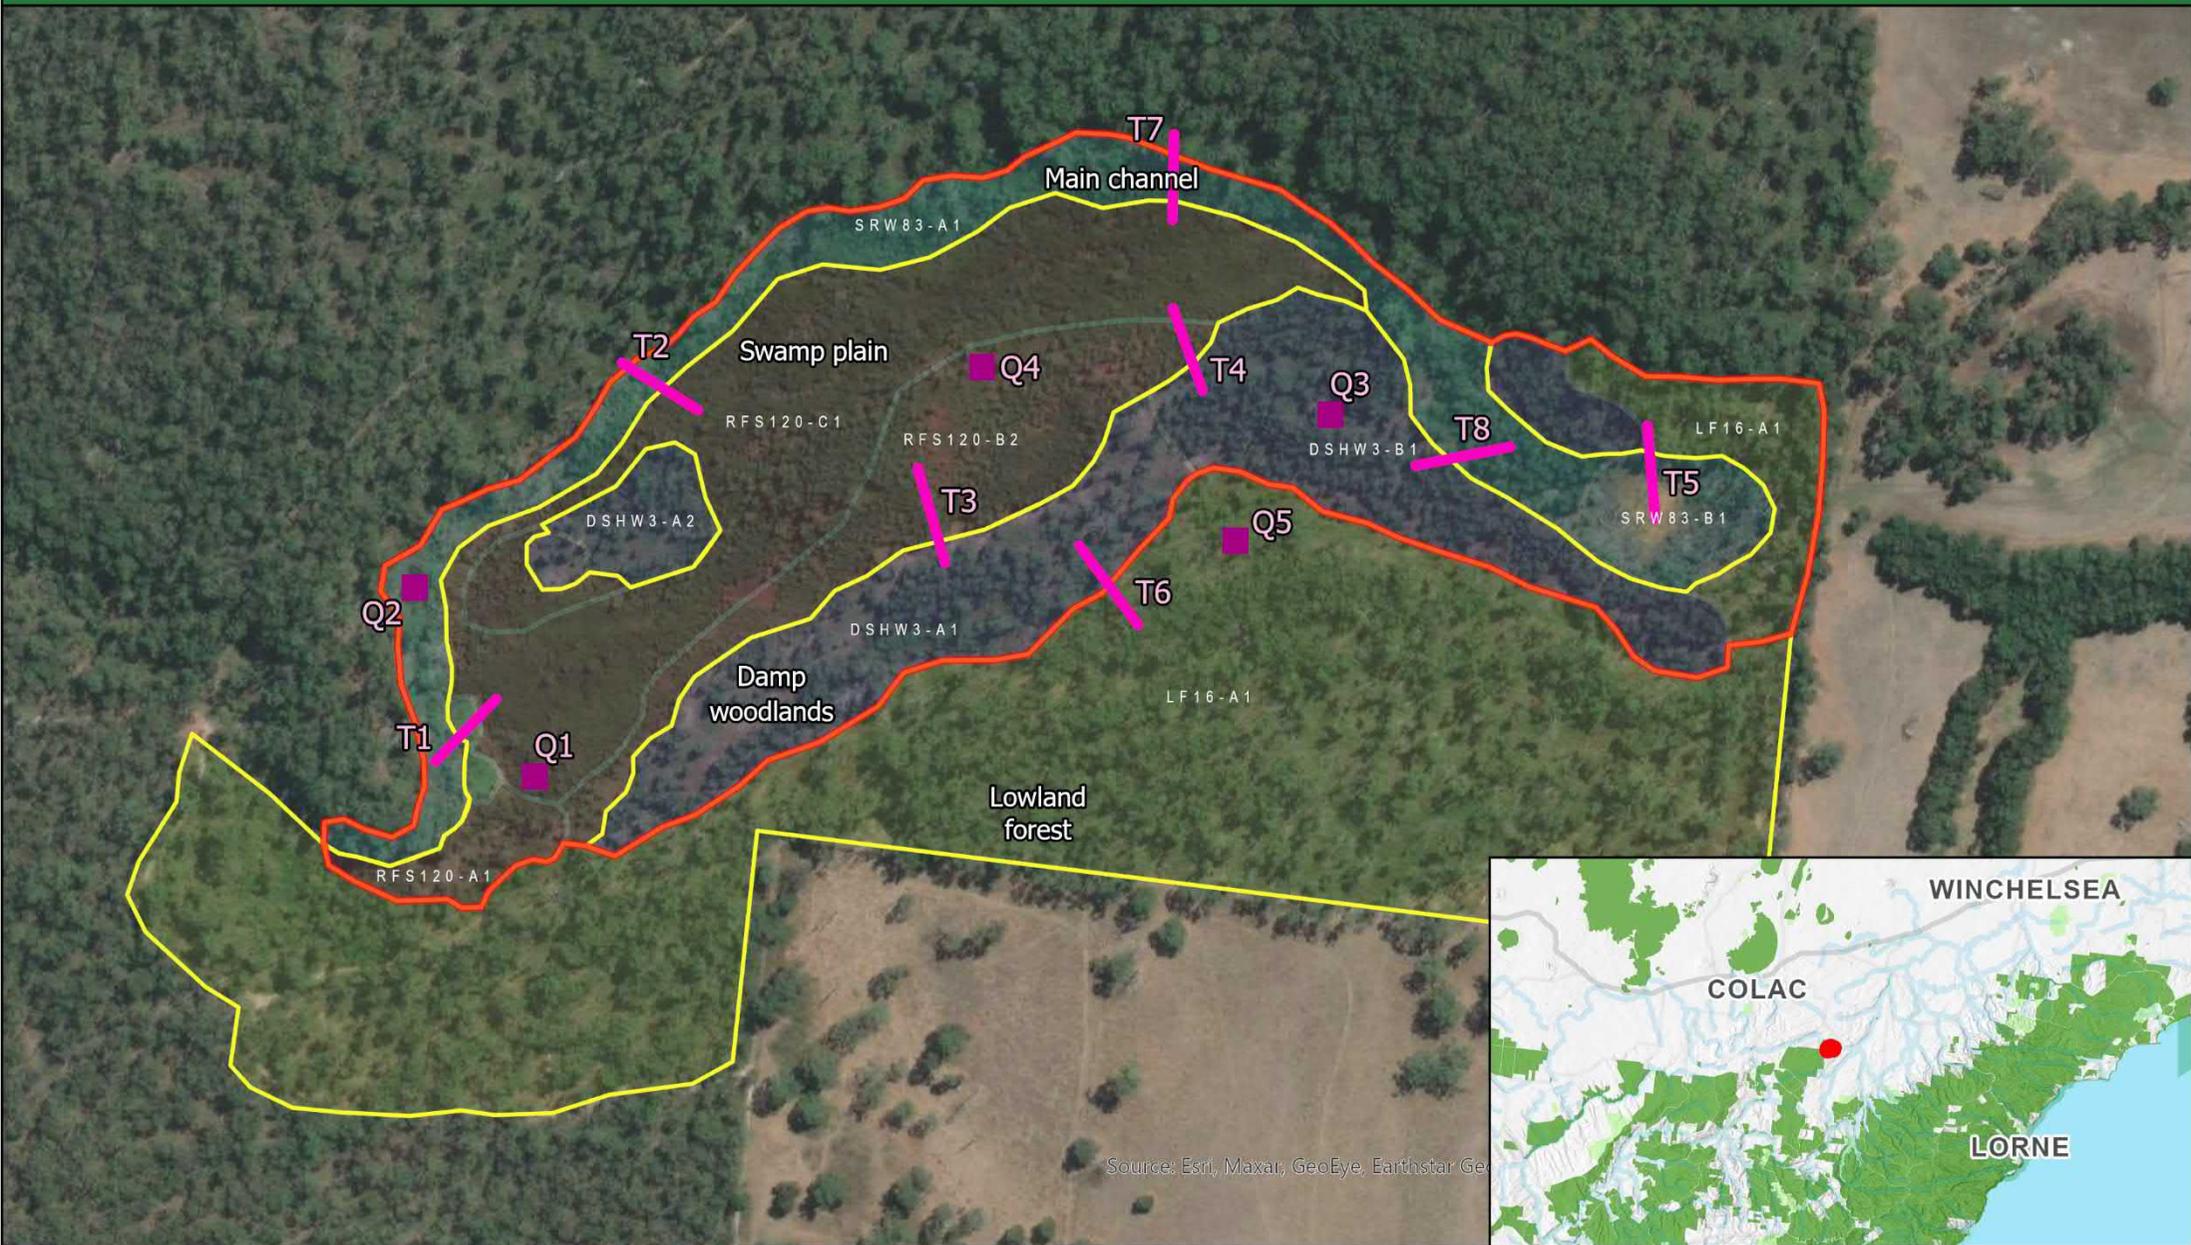

The Main Channel is located along the northern edge of the swamp, and is associated with the Swampy Riparian Woodland community which is reliant on surface flows along the main channel and associated infiltration into the surrounding ground layer. The depth of the channel and variation in elevation along the banks means inundation may have been limited to seasonal floods and localised depressions. Tall forest species less tolerant of inundation, such as Brooker's Gum and Manna Gum, were also present further up the bank as the community shifted into Lowland Forest on the northern edge.

Swampy Riparian Woodland contains a scattered tree layer, dominated by Swamp Gum (*Eucalyptus ovata*), Brooker's Gum (*Eucalyptus brookeriana*) and Manna Gum (*Eucalyptus viminalis*), often over a secondary tree layer. In elevated sections with limited inundation a variety of ground, scrambling and tree ferns were common. The creek channel supported a range of aquatic and semi-aquatic forbs and sedges. Swampy Riparian Woodland vegetation associations identified within the swamp are listed in Table 3.

**Table 3. Swampy Riparian Woodland vegetation associations in Big Swamp**

Vegetation associations	Description	Floristic diversity	Structural diversity	Dominant species
High-diversity Swampy Riparian Woodland (SRW83-A)	Following the main channel, this structurally and floristically complex riparian woodland exhibits a diversity of fine-scale variation.	High	High	Swamp Gum ( <i>Eucalyptus ovata</i> ), Brooker's Gum ( <i>Eucalyptus brookeriana</i> ), Woolly Tea-tree ( <i>Leptospermum lanigerum</i> ), Hazel Pomaderris ( <i>Pomaderris aspera</i> ), Common Water-ribbons ( <i>Cycnogeton procerum</i> ), Soft Tree-fern ( <i>Dicksonia antarctica</i> )
Flooded Swampy Riparian Woodland (SRW83-B)	A flooded section of woodland with only dead stags persisting. Wetland and aquatic vegetation has begun to colonise shallow sections.	Low	Low	N/A

### 3. Methods

The vegetation assessments were conducted by ELA ecologists James Garden and Rani Sherriff on 23 to 27 November 2020. Methods for each of the survey tasks are described below.

#### 3.1 Vegetation transects

The vegetation of the study area was sampled using five 50m long vegetation transects aligned from the perimeter of the swamp into the core, crossing various vegetation community boundaries in the process. The start of each transect was permanently marked with a 1500mm high, yellow-capped star picket so that the transects can be used for ongoing monitoring. A photo point was established at the star picket at the start of each transect.

The location of transects were chosen so as to intersect vegetation association boundaries which are considered to align with environmental gradients or features (e.g. inundation, soils etc). This will allow for the future comparison of floristic diversity and structure associated with the differing vegetation associations (and therefore underlying environmental drivers), whilst also providing the basis for tracking gradual changes in the extent of vegetation communities over the long-term.

All flora species at each 25cm interval along the transect were recorded. In addition, the ground attribute occurring at each 25cm point was recorded, including one of either bare ground, bryophytes, litter, water and log. The data provides an overall frequency of each plant species and ground attribute occurring across the transect as well as a snapshot of the distribution of functional plant groups and species across wetland gradients. Transect data has been used to inform the dominant species associated with each vegetation association.

### 3.1.1 Analysis

The 50 m transects within Big Swamp include the transition point between two vegetation types. The transition point is the key point for monitoring, as it will determine over time whether the vegetation communities in the swamp are encroaching, receding, or transitioning.

Results of species records from each of the 200 monitoring points along the transects in the Big Swamp were converted into a vegetation dominance code, to analyse the overall environment of the transects. Species lists from each of the vegetation types identified in the report Assessment of historical and current vegetation diversity and condition within Big Swamp (ELA 2019) were used to develop a list of key and indicator species, then each point along the transect was compared to this list and coded for dominance of vegetation type. The code choice was manually assigned by an ecologist based first on overstorey, then on the dominant characters of the understorey. When no vegetation was present, or the site contained only weeds, the groundcover recorded was reported (i.e. litter, bryophytes, logs and water). The transect data were randomised to prevent any perceived patterns biasing the ecologists code choice.

The vegetation types and dominant species are given in Appendix A.

## 3.2 Flora species quadrats

Five flora species quadrats were established within the Big Swamp and surrounding vegetation (Table 5). Optimum quadrats size was determined by measuring nested quadrats in the first (and most floristically diverse) vegetation community, and plotting a species-area curve. The quadrats size at which the species-area curve flattens is determined to be the 'optimal' size for detecting the majority of flora species present; the flattening of the curve indicates that no or few additional species are likely to be recorded with greater quadrat size.

Quadrat size of 8 x 8 metres was chosen based on the species area curve (Figure 2). A permanent flora quadrat was then established within each of the vegetation types in the swamp and surrounding vegetation. One corner was permanently marked with a 1500mm high, yellow-capped star picket, and direction of quadrat layout from the star picket recorded. A photopoint was established at the star picket location of each quadrat.

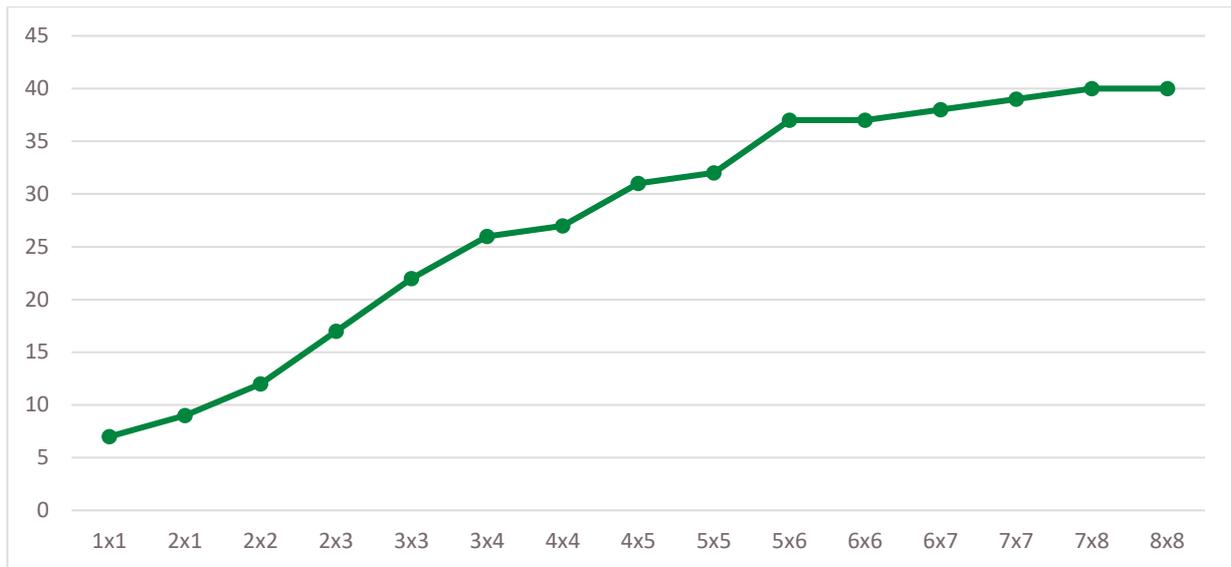

Figure 2. Species-area curve for determining quadrat size

Table 5. Quadrat location and vegetation types

Quadrat ID	Ecohydrological zone	Vegetation association	Marker coordinates	Orientation
Q1	Swamp Plain	Dry riparian fern scrub (RFS120-B)	143.6942694°E 38.4233453°S	North-west
Q2	Main channel	High-diversity Swampy Riparian Woodland (SRW83-A)	143.6935421°E 38.4224026°S	North-west
Q3	Damp Woodlands	Modified, closed Damp Sands Herb-rich Woodland (DSHW3-B)	143.6992889°E 38.4217217°S	North-east
Q4	Swamp Plain	High-diversity riparian fern scrub (RFS120-A)	143.6971363°E 38.4214326°S	North-west
Q5	Lowland forest	Lowland Forest (LF16-A1)	143.6987042°E 38.4223024°S	South-east

Within each quadrat, all vascular plant species present were recorded and assigned a cover/abundance value using the Braun-Blanquet scale (Table 6).

Table 6. Braun-Blanquet scale

Score	Cover / Abundance
+	<1% Very few individuals
1	1-5% Many individuals
2	5-25%
3	25-50%
4	50-75%
5	75-100%

### 3.3 Climate Data

The long-term average annual rainfall for Colac is 727 mm. Both the 2019 and 2020 survey were conducted within years of below average rainfall, following the wet winter months with a large proportion of the annual rainfall (>45%) occurring.

Climate statistics are given in Table 7 and Table 8 below.

**Table 7. Monthly rainfall prior to the 2019 and 2020 surveys (BOM 2021)**

Month	Rainfall (mm)	
	2019	2020
Rainfall total for 3 months prior to survey (mm)	286.4	277
Rainfall total for 12 months prior to survey (mm)	509.5	650

**Table 8. Climate data during the 2020 survey (BOM 2020)**

Date	Temperature (°C)	Rainfall (mm)
23 November 2020	20.6	20.4
24 November 2020	19.8	0
25 November 2020	28	0.2
26 November 2020	21.8	0
27 November 2020	32.3	0

## 4. Results

### 4.1 Vegetation transects

#### 4.1.1 Swamp Plain

Transects 1, 2, 3, and 4 traverse the boundary between tree-dominated woodlands and the scrub-dominated swamp plain. Results from 2020 for all transects show that there are a variety of dominances of vegetation type across the different transects.

Transect 1 showed a shift away from the less diverse dry riparian fern scrub (RFS120-B) vegetation type, with increases in the similar but more diverse vegetation association High diversity riparian fern scrub (RFS120-A) and Wet Verge Sedgeland (WVS932-A) (Figure 3). There was a decrease in the dominance of Lowland Forest vegetation (LF-16A) and an increase in the Swampy Riparian Woodland community (SWR83-A).

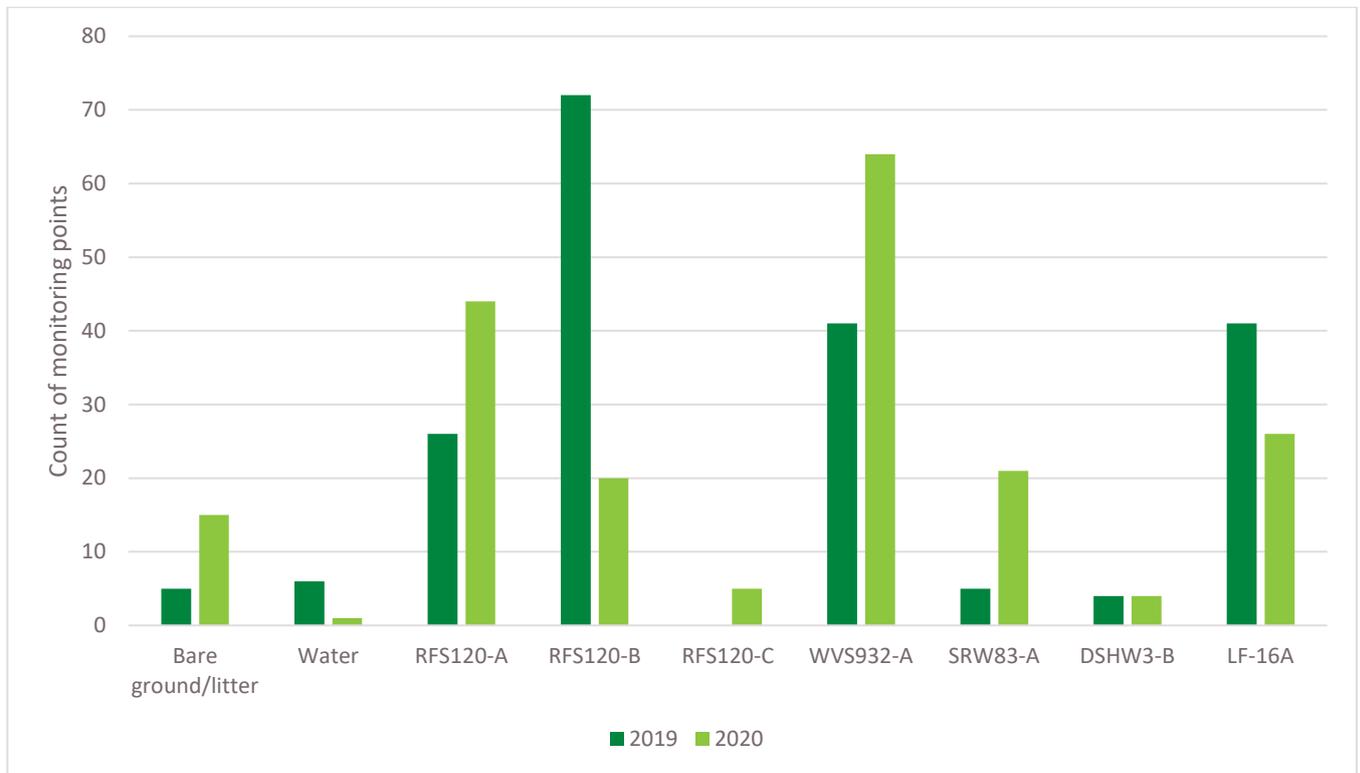

Figure 3. Transect 1 vegetation type dominance 2019 and 2020

Transect 2 also recorded a small decrease in the dry riparian fern scrub (RFS120-B) vegetation association and small increase was recorded in High diversity riparian fern scrub (RFS120-A) (Figure 4). Increases were also recorded in woodland and forest vegetation types.

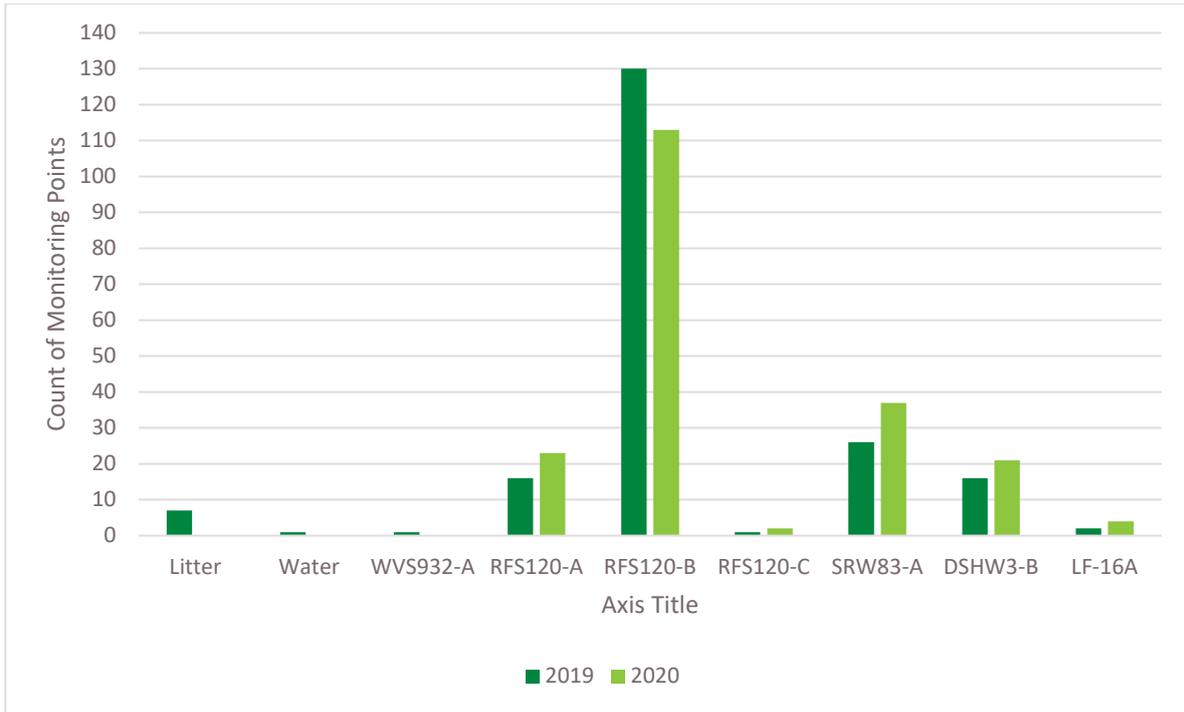

Figure 4. Transect 2 vegetation type dominance 2019 and 2020

On transect 3, there was generally more consistency, with vegetation either being associated with Riparian Fern Scrub or Damp-sands herb rich woodland (Figure 5). Open damp-sands herb-rich woodland (DSHW3-A) and Dry riparian fern scrub (RFS120-B) were dominant in both years, with a slight increase in both in 2020 (5% and 11% respectively). These vegetation associations both represent low-diversity impacted communities, represented by one or two species and dominated by Bracken (*Pteridium esculentum* subsp. *esculentum*).

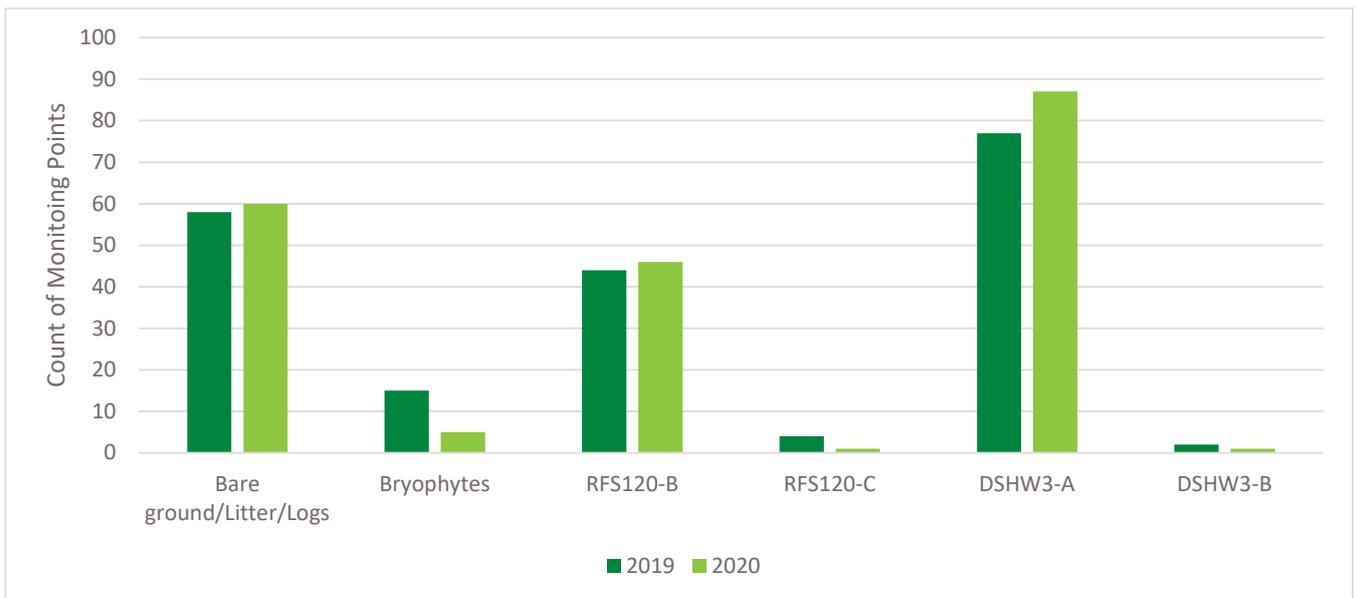

Figure 5. Transect 3 vegetation type dominance 2019 and 2020

Transect 4 recorded a 19% increase in the wet riparian fern scrub (RFS120-C) vegetation association which is largely accounted for by a change in bare ground and litter (Figure 6). All other vegetation types remained in relatively similar proportions.

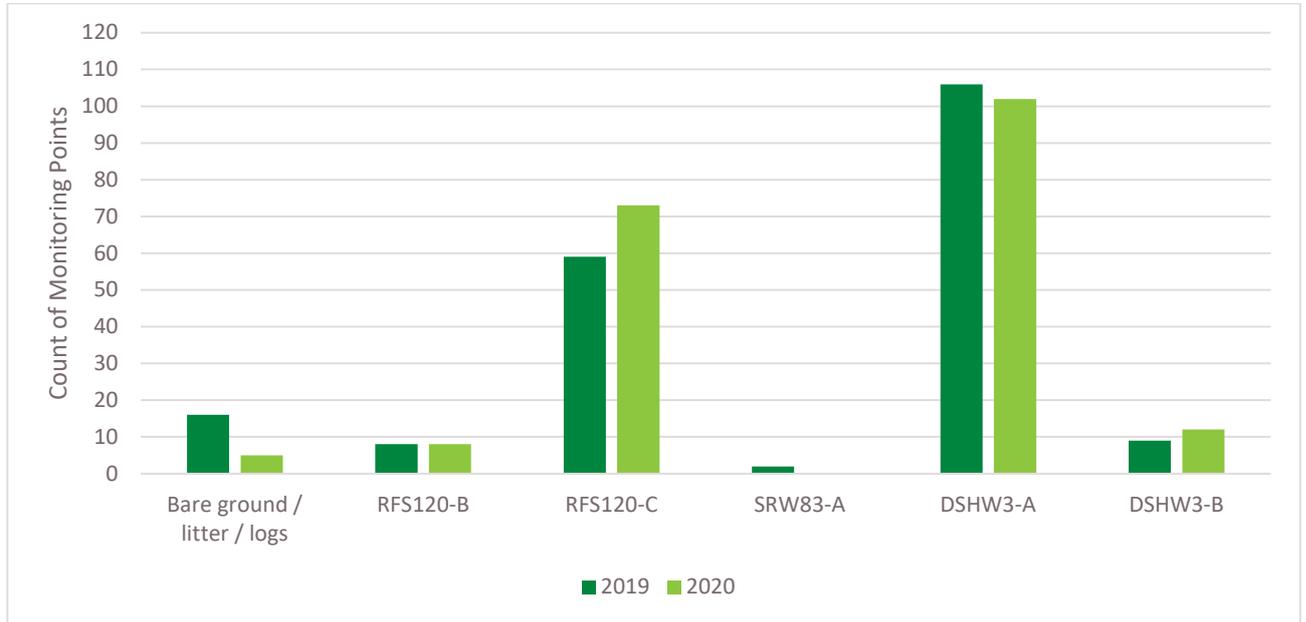

Figure 6. Transect 4 vegetation type dominance 2019 and 2020

4.1.2 Lowland forest and Damp woodlands

Transect 6 was installed in 2020 to monitor the lowland forest (LF16-A) – damp-sands herb-rich woodland (DSHW3) boundary (Figure 7). The current transect shows 18% of the transect is dominated by lowland forest and 73% by damp-sands herb-rich woodland, with the more diverse closed woodland type making up the majority (62%) of the vegetation. A small proportion of the transect was classed as Dry riparian fern scrub (RFS120-B) (2%) or litter/bare ground/weeds (6%).

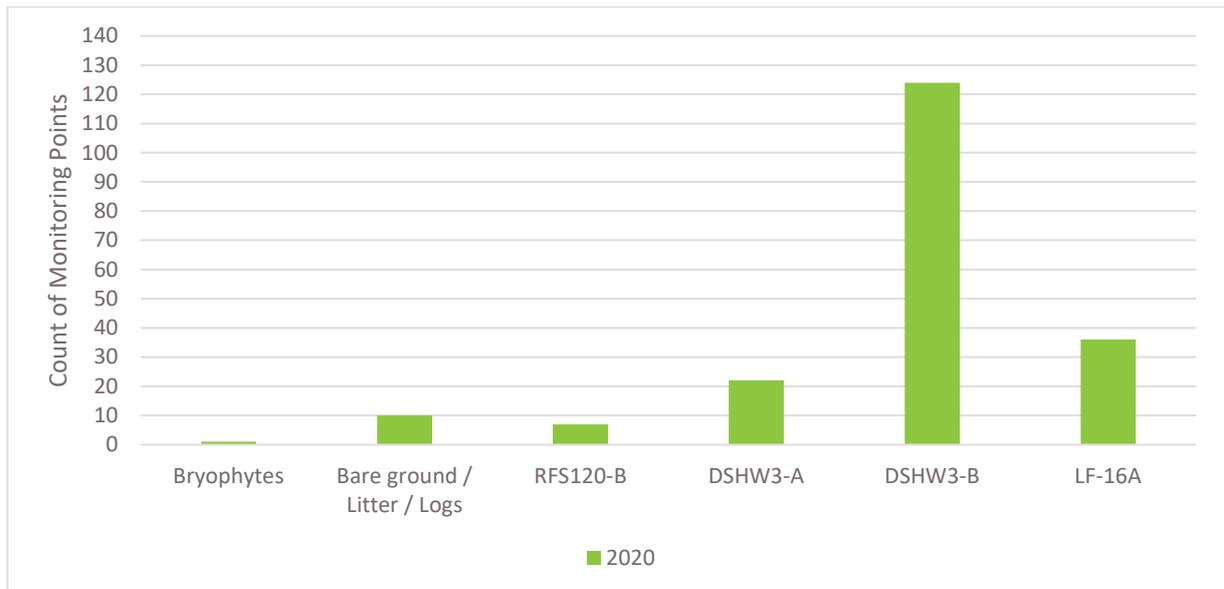

Figure 7. Transect 6 vegetation type dominance

### 4.1.3 Main Channel

Transect 5 intersects the main channel and the adjacent swamp plain and woodland vegetation. Results from the 2020 survey compared to 2019 show there was slightly more water present (Figure 8). Lowland forest species were notably absent from the 2020 survey. There was no consistent trend recorded across the other vegetation types.

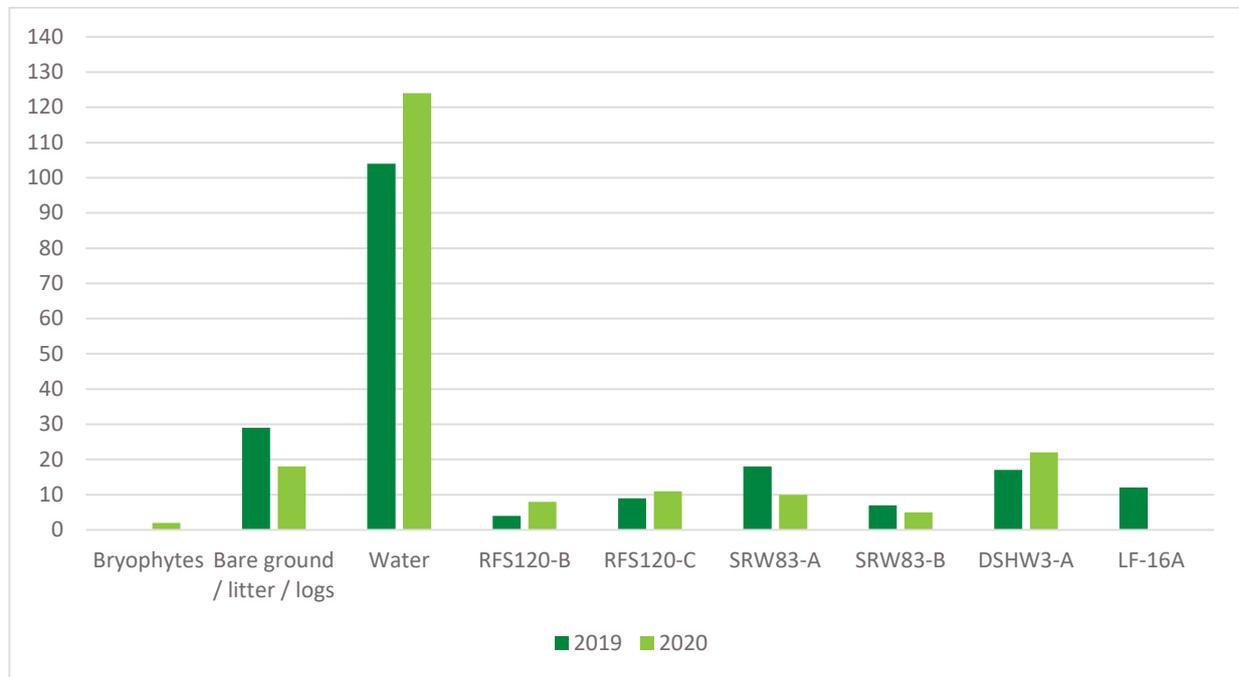

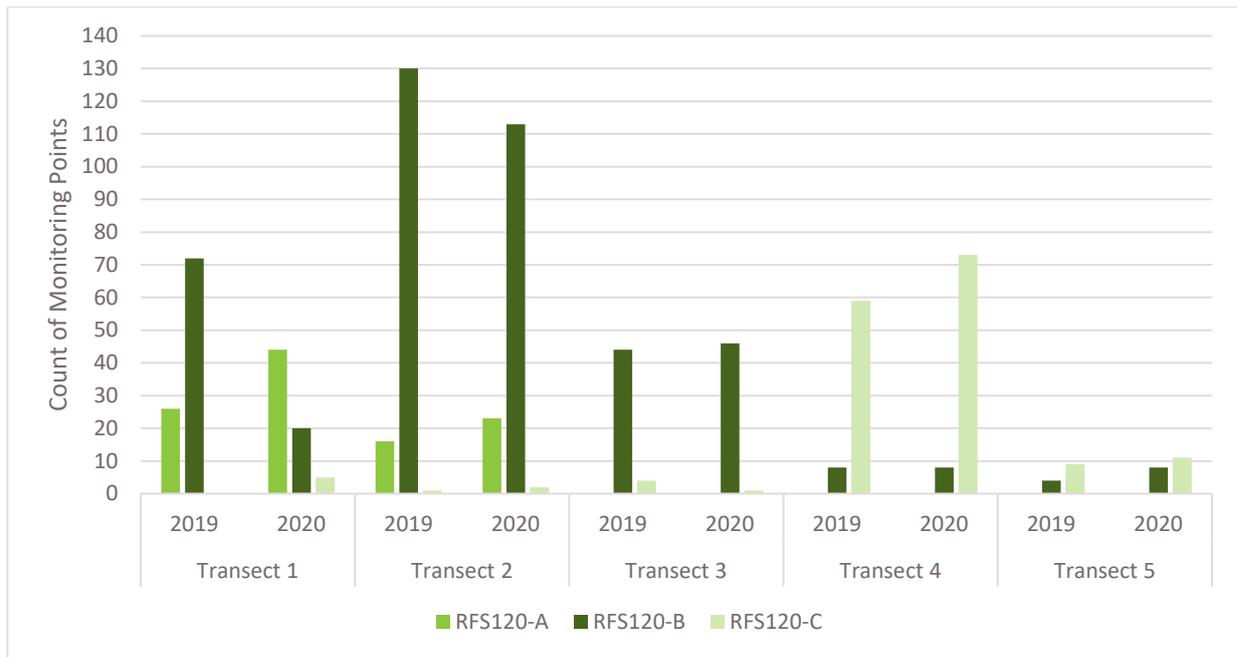

Figure 8. Transect 5 vegetation type dominance 2019 and 2020

### 4.1.4 Floristic Diversity of the Swamp Plain

Three Swamp Plain vegetation associations are present, as described in Appendix A, High-diversity riparian fern scrub (RFS120-A), Dry riparian fern scrub (RFS120-B) and Wet riparian fern scrub (RFS120-C). High diversity riparian fern scrub is considered the most structurally and floristically intact form of this community (ELA 2019). The other two variants represent a dry (RFS120-B) and a wet (RFS120-C) form of the vegetation association which are more impacted and have less structural diversity.

Transects 1-5 which were remeasured in 2020 all contain some areas of swamp plain. Figure 9 below shows data from all five remeasured transects in 2019 and 2020 for these vegetation associations. Transect 1 and 2 show a trend towards the high-diversity riparian fern scrub and away from the (lower diversity) dry riparian fern scrub association. Transect 4 and 5 show a slight trend away from dry riparian fern scrub towards the slightly more diverse Wet riparian fern scrub association. Transect 3 shows no substantial change.

**Figure 9. Floristic diversity of Swamp Plain transects 2019 and 2020**

## 4.2 Floristic quadrats

### *Flora species richness and diversity*

Flora species richness is a count of all species measured within the quadrat. This was calculated by tallying all species recorded within one quadrat.

Flora species diversity is a measure of the abundance of all species, and takes into account structure of the vegetation, for example if a quadrat has many species but is dominated by cover of a few. Flora species diversity was calculated using Simpsons diversity Index (Magurran 2004). The Braun-Blanquet cover abundance was used as a proxy for the number of individuals present (Morris et al 2014, Smith & Grassle 1977).

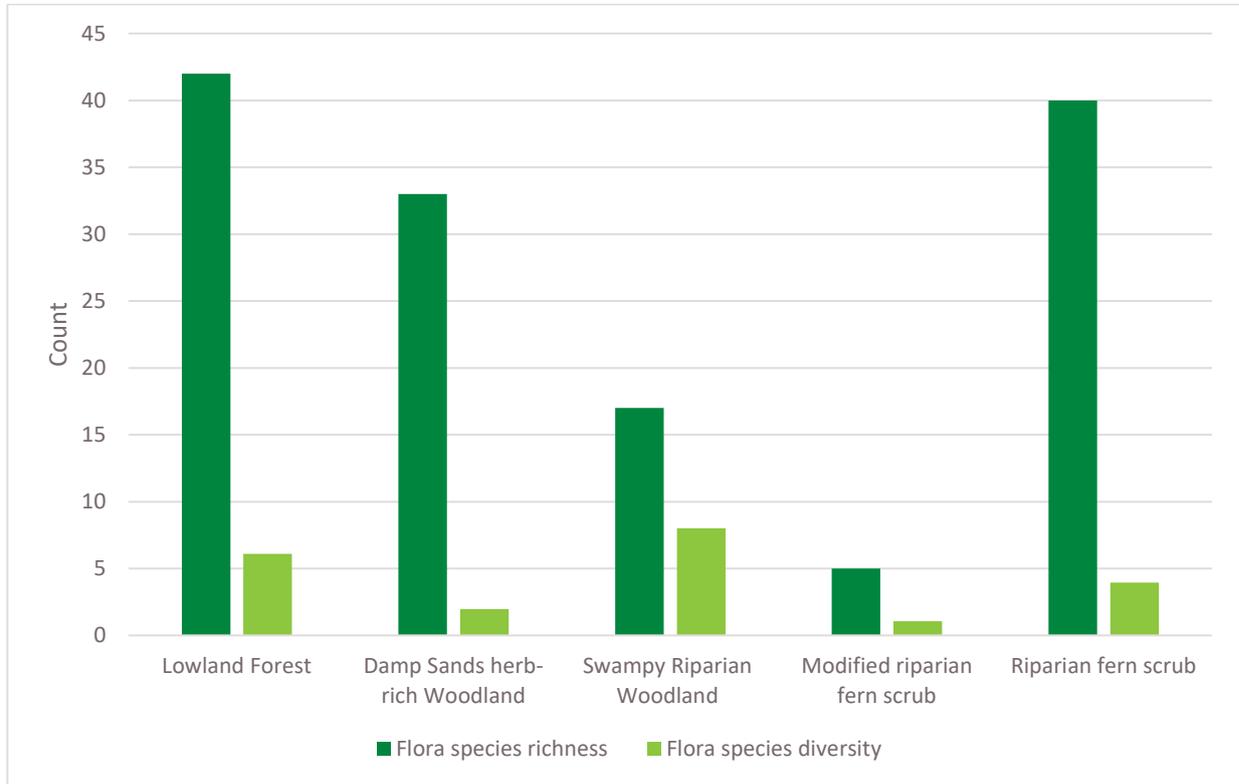

Flora species richness was highest in the Lowland Forest and the Riparian Fern Scrub, however species diversity was highest in the Swampy Riparian Woodland (Table 9, Figure 10). This indicates that many species are present in all these vegetation types, but swampy woodland has a greater number of species contributing to quadrat cover, which indicates higher structural diversity.

The species richness and species diversity of the Riparian Fern Scrub vegetation in the west of the swamp is currently high. The vegetation is in good condition with high structural diversity. The baseline data from the flora quadrats indicates that a drop in species diversity is likely to indicate a shift towards the more disturbed environment of the regenerating scrub.

The modified Riparian Fern Scrub vegetation which is regenerating from the impacts of fire and changed hydrology was the least species rich and species diverse. This indicates that the species quadrats will be an appropriate measurement to track changes in this community as it regenerates.

**Table 9. Floristic quadrat results**

	Q1	Q2	Q3	Q4	Q5
Flora species richness	40	42	17	5	33
Flora species diversity	3.95	6.10	1.97	1.07	8.00

**Figure 10. Flora species richness from quadrats**

## 5. Discussion

The following provides a discussion of the findings of the 2020 vegetation monitoring assessment against the success criteria outlined in the REPP.

### 5.1 Encroachment of terrestrial woodland into the swamp plain.

Transect 1 showed decrease in dominance of Lowland Forest vegetation (LF-16A) which may indicate a positive trend away from forest dominance on the swamp plain, however there was an increase in the Swamp Riparian Woodland community (SWR83-A) so the trend is not yet clear.

Transect 2 recorded a small decrease in the dry riparian fern scrub (RFS120-B) and a small increase in the high diversity riparian fern scrub (RFS120-A). However, increases were also recorded in woodland and forest vegetation types. Overall this indicates an increase in diversity, but does not consistently indicate a trend towards swamp plain vegetation.

Transect 3 may be trending slightly towards drier less diverse vegetation, however the changes are not substantial. Open damp-sands herb-rich woodland (DSHW3-A) and Dry riparian fern scrub (RFS120-B) were dominant in both years, with a slight increase in both communities in 2020. These vegetation associations both represent low-diversity impacted communities dominated by Bracken (*Pteridium esculentum* subsp. *esculentum*).

Results for transect 4 showed an increase in the wet riparian fern scrub (RFS120-C) vegetation association, however, this was mostly accounted for by a change in bare ground and litter, and there was no substantial change in woodland vegetation.

Overall, there was no substantial and consistent trend to indicate that the terrestrial woodland has further encroached into the swamp plain, and on some sites woodland species presence has decreased.

### 5.2 Encroachment of Lowland Forest dominant species into areas of Damp Forest.

No consistent data on the encroachment of the lowland forest has yet been recorded. Transect 6 was installed during the current survey to establish a baseline for clearly measuring this success criteria.

Transects 1,2 and 5 have some presence of Lowland Forest species. Transect 1 showed a decrease in lowland species dominance, and all of the lowland forest dominant areas on Transect 5 had changed to woodland or swamp dominance between 2019 to 2020. Transect 2 showed a very small increase in Lowland Forest vegetation.

Overall, there may be a slight trend away from Lowland Forest species, though this was not consistently recorded. Future surveys which include remeasurement of Transect 6 should provide a clearer indication of this success criteria.

### 5.3 Structural or floristic diversity of main channel and western end of the swamp.

Results from the 2020 survey transect compared to 2019 showed that there was slightly more water present in this area during the 2020 survey (Figure 9).

Species from the Lowland forest vegetation association were absent from the 2020 survey, which may show a trend towards a wetter swamp environment, with lowland forest species being displaced. There was no consistent trend recorded across the other vegetation types, indicating no substantial decreases in structural or floristic diversity.

These results indicate there has been no loss of structural or floristic diversity between 2019 and 2020. There is a slight trend away from forest species which may lead to an increase in swamp diversity over time.

#### 5.4 Diversity of understorey species within the swamp plain

Floristic quadrats were established in 2020 survey to accurately measure the diversity of understorey species across the swamp plain. The 2020 assessment of the quadrats show that the areas of modified riparian fern scrub compared to intact riparian fern scrub differ greatly in species richness and diversity measurements (Figure 10). Increase in the diversity of the swamp plain will be recorded in future surveys by remeasure of these quadrats to compare with these baseline data.

Three Swamp Plain vegetation associations were used in the transect classifications (following ELA 2019, and see appendix A). Two transect, 1 and 2, show a positive trend towards the more diverse and intact vegetation association RFS120-A. None of the remeasured transects were trending towards the most impacted association RFS120-B.

Together the results indicate there has been no loss of diversity in the swamp plain between 2019 and 2020, and in some sites the trend is positive towards increased diversity. Future surveys will establish this further with incorporation of quadrats results.

## Appendix E Quadrat survey

**Table C1. Quadrat 1 species list**

Species	Cover
<i>Lycopus australis</i>	3
<i>Holcus lanatus</i>	4
<i>Cirsium vulgare</i>	+
<i>Mentha australis</i>	1
<i>Hypochaeris radicata</i>	2
<i>Alternanthera denticulata s.l.</i>	2
<i>Rumex sp.</i>	+
<i>Carex appressa</i>	3
<i>Leptospermum myrsinoides</i>	2
<i>Leptospermum continentale</i>	4
<i>Oxalis exilis</i>	+
<i>Acaena novae-zelandiae</i>	1
<i>Lepidosperma elatius</i>	+
<i>Senecio prenanthoides</i>	+
<i>Carex sp.</i>	+
<i>Lobelia prateoides</i>	+
<i>poa annua</i>	+
<i>Centipeda spp.</i>	+
<i>Sonchus oleraceus</i>	+
<i>Pteridium esculentum subsp. esculentum</i>	1
<i>Acacia spp.</i>	+
<i>Galium aparine</i>	1
<i>Cerastium glomeratum s.l.</i>	+
<i>melaleuca squarrosa</i>	1
<i>Anthoxanthum odoratum</i>	+
<i>Senecio minimus</i>	+
<i>poaceae sp.</i>	1
<i>Carex fascicularis</i>	1
<i>Juncus pauciflorus</i>	+
<i>juncus spp.</i>	+
<i>Asperula conferta</i>	+
<i>Eucalyptus ovata</i>	1
<i>Prunus spp.</i>	+

Species	Cover
<i>Hydrocotyle hirta</i>	+
<i>Isolepis spp.</i>	+
<i>Bursaria spinosa</i>	+
<i>Lobelia beaugleholei</i>	1
<i>Galium ciliare subsp. terminale</i>	+
<i>Poa sp.</i>	+
<i>Centaurium erythraea</i>	+

Table C2. Quadrat 2 species list

Species	Cover
<i>Acacia melanoxydon</i>	3
<i>Acacia verticillata</i>	1
<i>Alternanthera denticulata</i>	+
<i>Anthoxanthum odoratum</i>	+
<i>Blechnum nudum</i>	1
<i>Blechnum spp.</i>	+
<i>Carex appressa</i>	2
<i>Carex fascicularis</i>	1
<i>Centaurium erythraea</i>	+
<i>Cerastium glomeratum s.l.</i>	+
<i>Coprosma quadrifida</i>	1
<i>Cycnogeton procerum s.s.</i>	1
<i>Eucalyptus brookeriana</i>	2
<i>Gahnia sieberiana</i>	2
<i>Galium aparine</i>	1
<i>Galium ciliare subsp. terminale</i>	+
<i>Gonocarpus tetragynus</i>	+
<i>Gynatrix pulchella</i>	2
<i>Holcus lanatus</i>	1
<i>Hydrocotyle hirta</i>	+
<i>Hydrocotyle pterocarpa</i>	+
<i>Hypochoeris radicata</i>	+
<i>Juncus pauciflorus</i>	+
<i>Lepidosperma elatius</i>	2
<i>Leptospermum continentale</i>	3
<i>Lobelia beaugleholei</i>	+

Species	Cover
<i>Lobelia pratioides</i>	+
<i>Melaleuca squarrosa</i>	+
<i>Microlaena stipoides</i> var. <i>stipoides</i>	2
<i>Olearia lirata</i>	1
<i>Oxalis</i> spp.	+
<i>Poa</i> spp.	+
<i>Poa tenera</i>	3
<i>Pomaderris aspera</i>	3
<i>Pteridium esculentum</i> subsp. <i>esculentum</i>	3
<i>Rubus anglocandicans</i>	+
<i>Senecio minimus</i>	+
<i>Senecio prenanthoides</i>	+
<i>Sonchus oleraceus</i>	+
<i>Tetrarrhena juncea</i>	4
<i>Todea barbara</i>	+
<i>Viola hederacea</i>	1

Table C3. Quadrat 3 species list

Species	Cover
<i>Pteridium esculentum</i> subsp. <i>esculentum</i>	5
<i>Eucalyptus ovata</i>	4
<i>Senecio minimus</i>	2
<i>Senecio glomeratus</i>	1
